# About Us

## Our Company

**Syncit Group** is a European software development company specialized in end-to-end **eCommerce solutions**.

We are a Magento Business Solution Partner and an Adobe Solution Partner.

**SYNCIT GROUP**

## Our Product

Athena Search is an advanced, SaaS-based site search built for **eCommerce** stores.

It is constantly self-improving thanks to Machine Learning and Artificial Intelligence.

# Problem

A **slow loading speed** on a web page can lead to a lack of sales, conversions, and a general loss of traffic.

Modern consumers would prefer to search for a new page than spend time waiting for a page to load.

# Why is the Page Load Time Important?

It is a primary ranking factor and is important for SEO.

It is important for potential leads and customer losses.

It keeps customers happy and brings profit to the company.

## Why is the Page Load Time Important?

The speed of your site dramatically impacts your site's SEO and bounce rate. A high number of zero-second page hits means that **people don't wait** for your site to load before **they leave**.

The **one-second delay** resulted in a **4.9%** drop in the number of articles a visitor reads. The **three-second delay** resulted in a **7.9%** drop. Visitors read less when delays occur.

On average, if your website takes longer than **3 seconds** to load, approximately **40%** of your visitors will **abandon your site**. This means a slow website will drive customers away.

# Solution

There are a few actionable steps business owners can take to improve the speed of their website.

Using **Athena Category Navigation**, we are now able to boost the loading speed of the Category Navigation page.

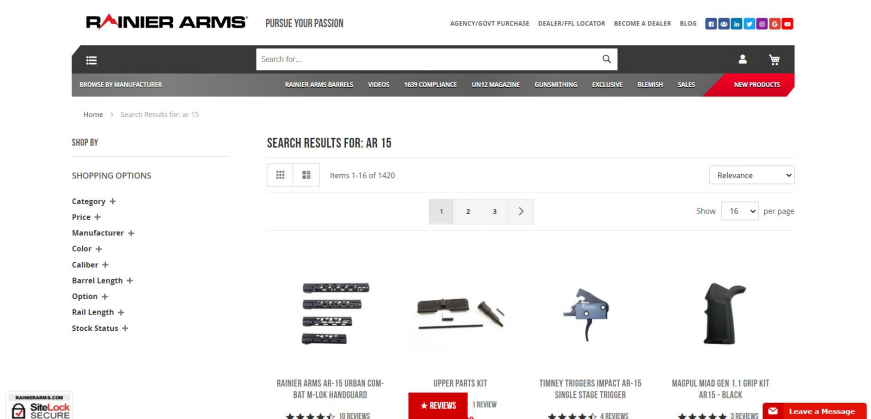

## Solution

All the changes that occur on the data are usually handled by the eCommerce platform itself.

We have transferred this job to Athena Category Search, thus making eCommerce platform **servers less impacted** by the volume of the customers.

So, we get a much **higher speed** of the website and a lot **cheaper servers**.

## Case Study

This Case Study will present handling categories through Athena Category Search on the Magento platform where we achieved outstanding performance compared to default Magento category handling.

It will point out the speed of and the server power for the Rainier Arms eCommerce store before and after the implementation of the Athena Category Navigation.

# Number of Servers \*

## 50% Improvement

\* servers are Amazon AWS EC2

# Number of vCPU Cores\*\*

## 64.7% Improvement

\*\* vCPU are AWS virtual cores

# Quantity of vRAM (GB)\*\*\*

## 50.4% Improvement

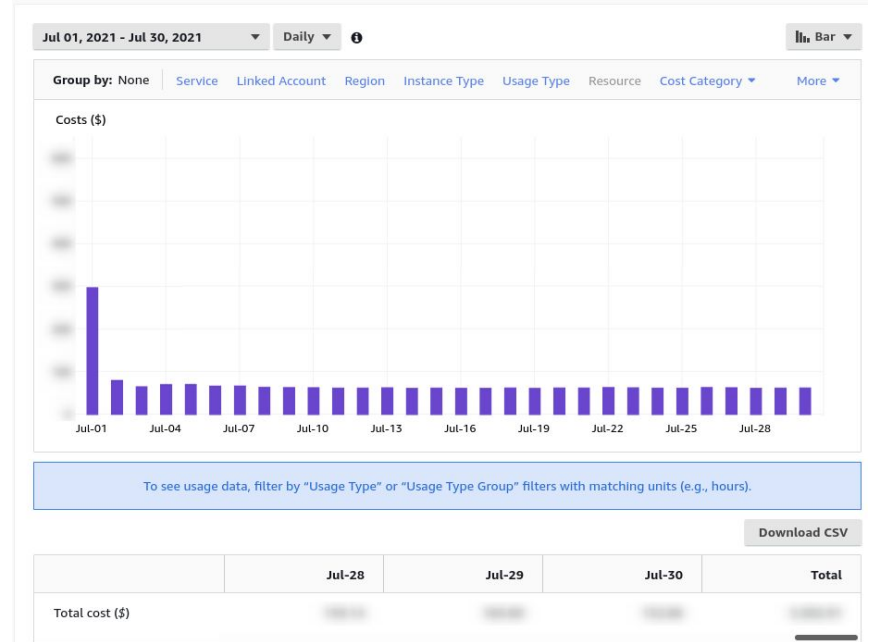

\*\*\* vRAM is AWS virtual RAM

# What We Have Achieved

- **33.3%** reduction in the number of **servers** used,
- **39.3%** reduction in the number of **CPU cores** used,
- **33.5%** reduction in the amount of **RAM** used.

# Conclusion

We have noticed a remarkable improvement in the response speed with **Athena Category Navigation**.

Not only have we reduced the load on the Magento servers by transferring part of the job to the Athena Category Search, but we also have greatly reduced the response time of the website on the category pages when Athena Category Search controls them.

**Save time, save money.**

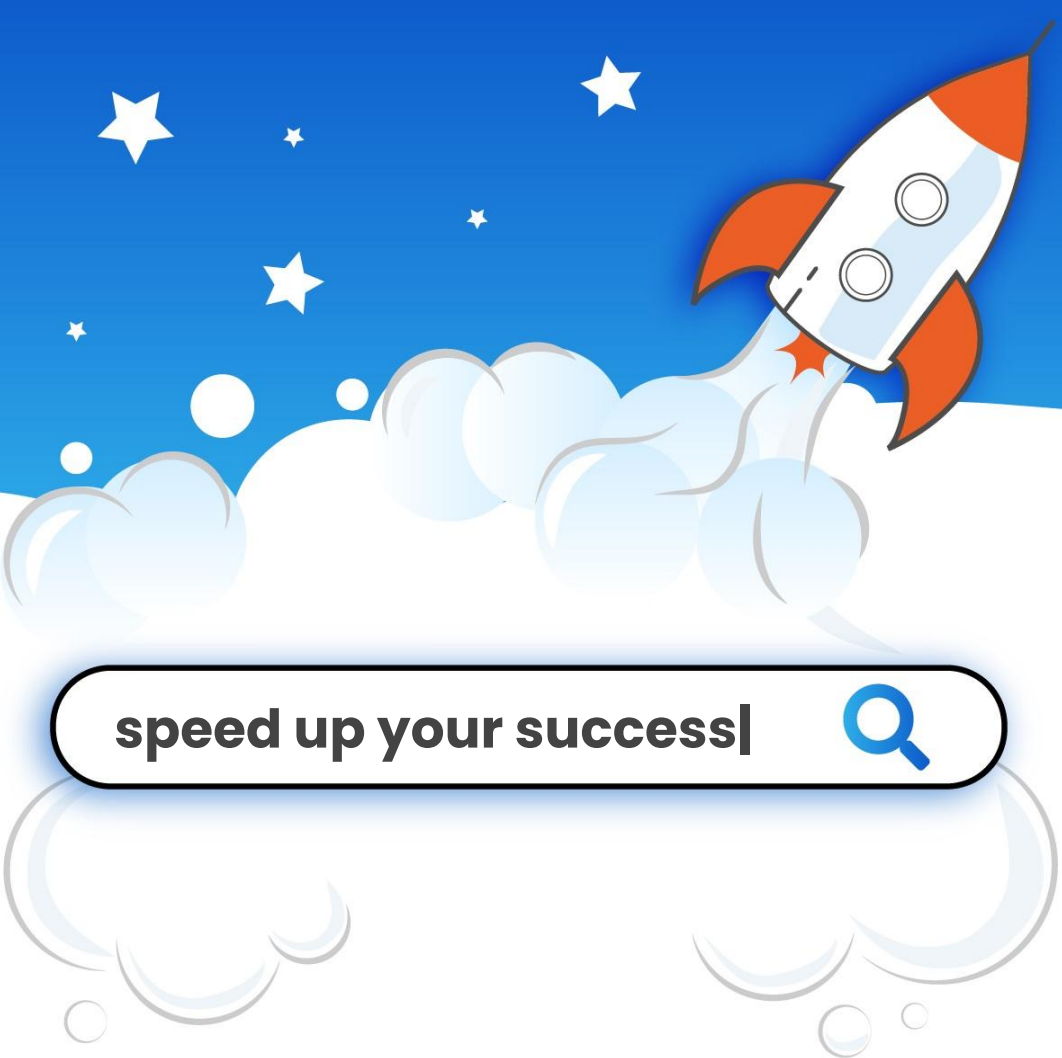

## Client's Words

*"We've seen a significant increase in **site speed** compared to pre-Athena, and have fielded significantly fewer complaints from customers regarding website speed."*
